Feature No. 1

Keep mites away with ingredients mites dislike!

Just spray on beds and blankets, carpets and sofas and let dry. The anti-mite components keeps mites away.

Feature No. 2

Not irritating to the skin, safe around children and pets!

Not irritating to the skin, it uses components safe enough to touch the mouth. It is safe to use around children, recommended for people who avoided pesticides and insecticides. (Patch tested)

Feature No. 3

Lasts about 1 month!

It lasts about 2-3 laundry cycles, or about 1 month on carpets (based on test done internally).

Keep mites away & Inactivate droppings+dead mites

Dani Clin Double Care

Feature No. 1

Keeps mites away

Just spray on your bed and carpet. The solution exerts the anti-mite effect on the surface where mite feeds are. For washable items like bed sheets, the effect lasts about 2-3 laundry cycles, and for carpets it lasts about one month (tested internally).

Mites live deep down inside the bed or in the carpet, but dead mites and droppings are microscopic and extremely light, so they gradually raise to the surface and drift in the air. Also, pollen comes inside the house along with people or when ventilating.

The spray exerts its double effect of anti-mite and house dust control.

Feature No. 2

House dust* control

*dead mites, droppings and cedar pollen

The solution packs house dust (dead mites, droppings, cedar pollen) in and controls its activity.

Feature No. 3

Safety is the key

This spray adopts components that are less-irritant and safe even if it touches the mouth, so it could be used comfortably around beds.

Feature No. 4

Deodorizing effect

Contains sugar cane extract as deodorizing component. It deodorizes the smell you can't stand. *It does not eliminate all odor.

Feature No. 5

Sterilizing effect

The spray sterilizes beds and carpets. It uses skin-friendly elements. *It does not eliminate all bacteria.

It is impossible to cut out mites only with cleaning or laundry.

- How neatly you clean, or how often you wash, mites reproduce much faster than that.
- One mite multiplies to one hundred million in one summer. Microscopic mites multiply deep down in the carpet or inside the bed and blanket.

Mites usually live deep inside the fabric avoiding the light, but they come up to the surface to feed on dead mites, mite droppings, and human skin.

Vacuuming will only clean away mites and remains on the surface, leaving many inside to multiply.

Dani Clin Sprays have an effect to keep mites away, so they can't come up to the surface to feed, starving those inside the fabric.
